In order to establish the structure and geometry of compound (I), suitable crystals of this compound were prepared for X-ray analysis. The data obtained demonstrated an exclusive E geometry in the newly formed imine double bond. An ellipsoid plot of the product is provided in Fig. 1, and selected geometric parameters are included in Table 1.

The values for the bond lengths in the guanidine group are comparable to those found in the starting material aminoguanidine hydrochloride. The bond lengths reported for aminoguanidine are 1.32 Å for the two terminal exo C—N bonds of the guanidino group and 1.35 Å for the endo C—N bond of the guanidino group, which were calculated to correspond to a weighting of roughly 40% double-bond character for each of the exo C—N bonds and 20% double-bond character for the endo C—N bond. The bond lengths observed in the X-ray structure of compound (I) for the exo C10—N11 [1.324 (2) Å] and C10—N12 [1.317 (2) Å] bonds, and the endo C10—N9 [1.350 (2) Å] bond, were in close accordance with the corresponding bond lengths in the aminoguanidine molecule. Thus, the double bond of the guanidinium group in (I) is predominantly exo, as is observed in the aminoguanidine structure, in spite of the presence of a new arylimine grouping in the molecule. In the crystal structure, the chloride counter-ion is more closely associated with N12, which may account for the slightly shorter length of this terminal C10—N12 bond compared with the length of C10—N11.

Formation of the Schiff base at the C7—N8 bond also affects the length of the N8—N9 bond in (I). This corresponding N—N bond length in the aminoguanidine starting material was reported as 1.42 Å, but in (I), this bond was observed to have a length of 1.381 (2) Å, indicating slight double-bond character. The C1—C7 bond [1.459 (2) Å] is also shorter than a standard C—C σ bond, and it is clear that some

double-bond character is distributed to some extent along the C1 – C7 – N8 – N9 – C10 bond series. The bonds along this series of atoms (C1 – C7 – N8, C7 – N8 – N9 and N8 – N9 – C10; Table 1) are closer to the ideal value of 120° for angles between sp² atoms than to the value of 109.5° observed for sp³ atoms.

The assumption of an extended double-bond characteristic throughout the molecule is also supported by the planarity of the entire molecule, as is seen in the torsion angle values (Table 1). None of the torsion angles deviate by more than 10° from the plane of the molecule, except for the O atoms of the nitro group and the H atoms of the methyl group. Along the C6 – C1 – C7 – N8 – N9 – C10 chain of atoms, the torsion angles are a tight 176.38 (16), 178.78 (14) and 176.16 (15)° for C6 – C1 – C7 – N8, C1 – C7 – N8 – N9 and C7 – N8 – N9 – C10, respectively. Planarity of the molecule also extends through atoms O16 to C17, and thus includes the 4-methoxy group, as indicated by the C4 – O16 – C17 bond angle of 117.53 (13)°. The partial double-bond character of the C4 – O16 bond results in C3 and C17 possessing an E geometry, which is probably a result of the steric hindrance of the nitro substituent at position 3 of the benzene ring (C3). With the extended conjugation throughout the molecule, and the E geometry of the C7 – N8 bond, there is no possibility of intramolecular hydrogen-bond formation between the O atoms of the nitro group and the H atoms attached to N atoms of the guanidine group.

The crystal packing for (I) is illustrated in Fig. 2, viewed along the b direction. The flat molecules form parallel stacks along the b axis, as do the chloride ions. Each chloride ion forms five hydrogen bonds with each of the five guanidine H atoms, with H···A distances in the range 2.44 to 2.70 Å (see Table 2). This arrangement forms stable chains of intramolecular connectivity in the c direction.

The flat NH₂ groups were allowed to refine along the N–H vector to distances of 0.856 (17) and 0.813 (18) Å. H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained C–H distances of 0.95 (aromatic) and 0.98 Å (methyl), and an N–H distance of 0.88 Å. U_{iso}(H) values were set at either 1.5U_{eq} or 1.2U_{eq} of the attached atom.
