## Key indicators

Single-crystal X-ray study  
 $T = 173\text{ K}$   
Mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$   
Disorder in main residue  
 $R$  factor = 0.049  
 $wR$  factor = 0.129  
Data-to-parameter ratio = 12.3For details of how these key indicators were automatically derived from the article, see <http://journals.iucr.org/e>.Aquatetrakis(2-methylpyrazine- $\kappa N$ )(nitrate- $\kappa O$ )-copper(II) nitrate

The copper(II) ion in the title compound,  $[\text{Cu}(\text{NO}_3)(\text{mepyz})_4(\text{H}_2\text{O})]\text{NO}_3$ , where mepyz is 2-methylpyrazine ( $\text{C}_5\text{H}_6\text{N}_2$ ), has a distorted octahedral geometry with four N atoms of the methylpyrazine ligands in the equatorial positions and two O atoms from water and semi-coordinated nitrate moieties in the axial sites.

## Comment

The preparation of coordination complexes may be influenced by several factors, including metal-to-ligand mole ratio, leading to the formation of multiple structural types from a single set of components. For example, the reaction of copper(II) nitrate and 1,2-diazine (pyridazine, pdz) in various mole ratios produces four distinct products: the trimetallic complex,  $[\text{Cu}(\text{pdz})_3(\text{NO}_3)_3]_2\text{Cu}$ , and the monometallic complexes  $\text{Cu}(\text{pdz})_3(\text{NO}_3)_2$ ,  $\text{Cu}(\text{pdz})_4(\text{NO}_3)_2$  and  $[\text{Cu}(\text{pdz})_4(\text{NO}_3)](\text{NO}_3)$  (Otieno *et al.*, 1995). In the case of the 1,4-diazine (pyrazine, pyz) analogue, three different coordination polymers, having compositions of  $\text{Cu}(\text{pyz})(\text{NO}_3)_2$ ,  $\text{Cu}(\text{pyz})_2(\text{NO}_3)_2$  and  $\text{Cu}(\text{pyz})_3(\text{NO}_3)_2$ , are obtained (Otieno *et al.*, 2002). This work extends our investigations of the structural effects of copper(II)-nitrate-to-diazine-ligand mole ratio to include 2-methylpyrazine (mepyz).

The reaction of an aqueous solution of  $\text{Cu}(\text{NO}_3)_2 \cdot x\text{H}_2\text{O}$  and 2-methylpyrazine in a 1:1 molar ratio produces a coordination polymer with the stoichiometry  $\text{Cu}(\text{mepyz})(\text{NO}_3)_2$  (Amaral *et al.*, 2001). A 1:12 molar ratio of the same reagents in water produces a monometallic species of composition  $[\text{Cu}(\text{mepyz})_4(\text{H}_2\text{O})(\text{NO}_3)]\text{NO}_3$ , (I), whose structure is shown in Fig. 1. Selected bond lengths and angles are listed in Table 1. The compound consists of the  $[\text{Cu}(\text{mepyz})_4(\text{H}_2\text{O})(\text{NO}_3)]^+$  cation and  $\text{NO}_3^-$  counter-ion. The copper(II) ion has a distorted octahedral geometry with the four mepyz ligands in the equatorial positions and the semi-coordinated nitrate ion and water molecule in the axial sites. The mepyz ligands are

Atom-numbering scheme for the cation in the title compound, shown with 30% probability ellipsoids. The nitrate counter-ion has been omitted for clarity.

coordinated through the N atom distal to the methyl substituent and the pyrazine rings are twisted out of the  $\text{CuN}_4$  plane [average =  $54.37(15)^\circ$ , range =  $45.29(14)$ – $57.79(13)^\circ$ ], such that the  $\text{Cu}(\text{mepyz})_4$  fragment assumes a propeller structure. One O atom of each nitrate ion forms  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds in which the coordinated water molecule acts as the H-atom donor (Table 2). The title compound is isostructural with its perchlorate analogue,  $[\text{Cu}(\text{mepyz})_4(\text{H}_2\text{O})(\text{ClO}_4)]\text{ClO}_4$  (Navas *et al.*, 1993). The copper–ligand bond lengths in the latter compound are: average  $\text{Cu}-\text{N} = 2.033(3)$  Å,  $\text{Cu}-\text{OH}_2 = 2.310(3)$  Å and  $\text{Cu}-\text{OClO}_3 = 2.721(4)$  Å.

## Experimental

Dark-blue crystals of (I) were obtained by slow evaporation of a mixture of a 3 ml aqueous solution of  $\text{Cu}(\text{NO}_3)_2 \cdot 2.5\text{H}_2\text{O}$  (1.00 g, 4.30 mmol) and 2-methylpyrazine (4.70 ml, 4.84 g, 51.4 mmol). Analysis found: C 40.79, H 4.37, N 23.79;  $\text{C}_{20}\text{H}_{26}\text{CuN}_{10}\text{O}_7$  requires: C 41.27, H 4.50, N 24.06%. IR ( $\text{cm}^{-1}$ ): 1676 (*wbr*), 1602 (*m*), 1524 (*m*), 1478 (*m*), 1396 (*s*), 1373 (*s*), 1316 (*s*), 1298 (*s*), 1253 (*s*), 1081 (*s*), 1040 (*s*), 1028 (*s*), 827 (*s*), 743 (*m*), 497 (*s*), 425 (*s*). Elemental analyses were performed by Midwest Microlab, Indianapolis, Indiana. Infrared spectra were recorded from hexachloro-1,3-butadiene mulls sandwiched between KRS-5 plates (International Crystal Laboratories) on a Bio-Rad Model FTS3000 FT-IR spectrometer.

Symmetry code: (i)  $x - 1, y, z$ .

H atoms were found in difference Fourier maps and refined using a riding model. Disorder of one of the rings (N7), which causes it to occupy two positions related by a  $180^\circ$  rotation, was identified in a difference map. It was modelled so that both components would maintain similar geometry, but was otherwise freely refined.

Data collection: *COLLECT* (Nonius, 1998); cell refinement: *SCALEPACK* (Otwinowski & Minor, 1997); data reduction: *DENZO-SMN* (Otwinowski & Minor, 1997); program(s) used to solve structure: *SHELXS97* (Sheldrick, 1997); program(s) used to refine structure: *SHELXL97* (Sheldrick, 1997); molecular graphics: *XP* in *SHELXTL* (Sheldrick, 1994); software used to prepare material for publication: *SHELXL97* and local procedures.

This work was supported by Eastern Kentucky University and Kentucky NSF EPSCoR.
