Received 28 February 2008; accepted 6 March 2008

Key indicators: single-crystal X-ray study; $T = 90\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.049; wR factor = 0.112; data-to-parameter ratio = 15.5.

The 3-methylbutanoyl group and the 5-fluorouracil unit of the title compound, $\text{C}_9\text{H}_{11}\text{FN}_2\text{O}_3$, are essentially coplanar, with the carbonyl group oriented towards the ring CH group and away from the nearer ring carbonyl group. The 3-methylbutanoyl ($\text{C}=\text{C}-\text{N}-\text{C}=\text{O}$) torsion angle of $9.6(2)^\circ$ is comparable to that in structurally related compounds. In the solid state, two inversion-related molecules form $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds to generate an intermolecular $R_2^2(8)$ ring. The crystal structure also displays intra- and intermolecular $\text{C}-\text{H}\cdots\text{O}$ interactions.

5-Fluoro-1-(3-methylbutanoyl)pyrimidine-2,4(1*H*,3*H*)-dione

H.-J. Lehmler and S. Parkin

Comment

Despite their potential pharmaceutical application, the crystal structures of only five 1-acyl-5-fluorouracil derivatives have been described in the literature (Beall *et al.*, 1993; Jiang *et al.*, 1988; Lehmler & Parkin, 2000; Lehmler & Parkin, 2008). We herein describe the crystal structure of a new 1-acyl-5-fluorouracil derivative, 5-fluoro-1-(1-oxo-3-methylbutyl)-2,4(1*H*,3*H*)-pyrimidinedione.

The molecular structures of 1-acyl-5-fluorouracil derivatives are similar. The 1-acyl group and the 5-fluorouracil moiety are essentially coplanar, with the C7=O7 carbonyl group oriented towards the C6—H group and away from the C2=O2 group. The C6—N1—C7—O7 dihedral angle of the title compound is 9.6 (2) $^{\circ}$. The other 1-acyl-5-fluorouracil derivatives have comparable dihedral angles ranging from 1.6 $^{\circ}$ to 17.3 $^{\circ}$ (Beall *et al.*, 1993; Jiang *et al.*, 1988; Lehmler & Parkin, 2000; Lehmler & Parkin, 2008), which suggests that the carbonyl group of the 1-acyl group and the pyrimidine-2,4(1*H*,3*H*)-dione moiety are conjugated. The differences in the dihedral angles are most likely due to packing effects in the crystal.

Similar to the crystal structure of other 1-acyl-5-fluorouracil derivatives (Beall *et al.*, 1993; Lehmler & Parkin, 2000; Lehmler & Parkin, 2008), the crystal structure of the title compound contains inversion related molecules that form dimers in which two N—H \cdots O hydrogen bonds generate an intermolecular $R_2^2(8)$ ring. Furthermore, there are C—H \cdots O type intra and intermolecular interactions.

Experimental

5-Fluoro-1-(1-oxo-3-methylbutyl)-2,4(1*H*,3*H*)-pyrimidinedione was synthesized by acylation of 5-fluorouracil with 3-methylbutanoyl chloride and recrystallized from diethylether at -20°C (Beall *et al.*, 1997; Lehmler & Parkin, 2000; Roberts & Sloan, 1999).

Refinement

H atoms were found in difference Fourier maps and subsequently placed in idealized positions with constrained C—H distances of 0.98 Å (RCH₃), 0.99 Å (R_2 CH₂), 0.95 Å (C_{Ar}H) and 0.88 Å (NH) with $U_{\text{iso}}(\text{H})$ values set to either 1.2 U_{eq} or 1.5 U_{eq} (RCH₃ only) of the attached atom.

Figures

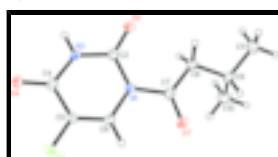

Fig. 1. View of the title compound showing the atom-labelling scheme. Displacement ellipsoids are drawn at the 50% probability level.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.049$	H-atom parameters constrained
$wR(F^2) = 0.112$	$w = 1/[\sigma^2(F_o^2) + (0.0498P)^2 + 0.0466P]$
$S = 1.07$	where $P = (F_o^2 + 2F_c^2)/3$
2139 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
138 parameters	$\Delta\rho_{\text{max}} = 0.27 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.29 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
